CVM business pack: agentic AI for Neo (NeoBuk) and Nyumba Zetu (Ask Nyumbani)

Source of product truth: codzure-solutions.vercel.app

CVM framework: Customer · Value · Mechanism, run as a six-stage cycle (Identify → Understand → Design value → Deliver → Capture → Measure). If we cannot name all three pillars on one screen, we are building a chat widget, not a top-1% agent.

Verdict

We do not win by wrapping a language model in a text box. We win if the agent finishes a job the user already pays for with time, cash, or fear — then waits for a yes before anything important is saved.

Product	Job that matters	Average if we miss it
Neo · NeoBuk	“Sold 3 bags cement to Mary, 1,500” → structured draft ; “who owes me?” from this shop	Chatbot that talks about bookkeeping
Nyumba Zetu · Ask Nyumbani	“3-bed Ruaka under 8M near a school” → real listings ; title fear → walkthrough on that listing	Listings FAQ bot

CVM pillars

Pillar	Question	Pass test
C — Customer	Whose job, in their words, on their phone, in Kenya?	Named person, workaround, fear or cost they already pay
V — Value	What finished job do they walk away with?	Confirmed action or grounded answer — not a fluent paragraph
M — Mechanism	How without breaking trust?	Named tool, port, confirm-before-write, honest “I don’t know”

CVM cycle (both products)

Stage	Neo	Nyumba Zetu
1 Identify	Hardware/retail SME owner	Buyer/seller in Nairobi–Kiambu belt
2 Understand	Notebook + WhatsApp + memory	Portals, brokers, Facebook; fraud fear
3 Design	Spoken sale → draft → confirm	Sentence search + listing-bound title checklist
4 Deliver	record_sale, outstanding, alerts	search_listings, run_due_diligence
5 Capture	Owner taps Confirm	Next actions; never cash in a car park
6 Measure	Time to first confirmed sale	Search precision; diligence completion

From the two websites (do not invent)

NeoBuk: sales tracking & reporting, expense management, inventory visibility, operational workflows. Ask Nyumbani: trusted property discovery, location-based search, land visibility with title-checklist guidance, curated resale marketplace. Markets: Nairobi, Kiambu, Westlands, Ruaka, Syokimau, Karen. Currency KES. Studio: practicality first, mobile-first, African market realities.

What to build

P0: Neo sale → draft → confirm; Nyumba sentence search; confirm/discard by id; golden evals + logs; standalone /agent on stubs.

P1: Diligence bound to a listing; Neo performance + outstanding + alerts-as-drafts; seller listing + comps.

P2 only after P0 is boring: WhatsApp, official lands-search partnership, voice notes.

Never: silent writes, title guarantees, two agent stacks, invented listings, auto-chasing customers without confirm.

Mechanism

User → handleAgentMessage → LLM tool loop or local operations brain → getTools("neo"|"nyumba") → ports in contract.ts → stubs now / real adapters at merge. Isolation: nothing outside /agent. Merge is one registerAgent call.

Scorecard

Metric	Healthy
First confirmed Neo sale	Under a minute including yes
Draft confirmation	Yes because the draft is right
Search	Area + price + beds
Diligence	Next actions on a listing id
Empty results	"I don't have that" — never invent
