

Top 1% agentic AI for Neo (NeoBuk) and Nyumba Zetu (Ask Nyumbani)

A top 1% agent **finishes a job** with tools on real product data, then **waits for a yes** before anything important is saved. The model is a router. Confirmation, grounding, and evals are the product. A CVM slide is optional; this standard is not.

Figure 1. Dual-product agent loop — also [demo.html](#).

99% vs 1%

99% chat widget	1% agent
Restates the marketing site	Calls tools on this shop / these listings
Invented numbers and properties	Empty result says “I don’t have that”
Silent write, or cannot write	Draft + Confirm / Discard by id
Dies without an API key	Local operations brain still completes P0 jobs
Two bots, no evals	One brain, two toolkits, golden tasks in CI
Sounds like a lawyer	Listing-bound checklist; not legal advice

The loop

Utterance → route by product → tool call to a port → ground in stub/live data → **read now** or **draft write** → eval on frozen tasks.

Flagship jobs

Neo	Nyumba Zetu
“sold 3 bags cement to Mary, 1,500” → draft → confirm	“3-bed Ruaka under 8M near a school” → real listings
“who owes me?” from this shop’s books	Title walkthrough bound to that listing id
Alerts (stock, overdue, margin) as drafts	Seller listing + comps, still confirm to publish

Build order

P0: sale draft, sentence search, confirm-by-id, evals + logs, standalone stubs.

P1: diligence, insights, alerts, seller comps.

P2: WhatsApp as a channel — only after P0 is boring.

Never: silent writes, title guarantees, two agent stacks, fake listings.
